Project Guide:

Dr. Renuka Mane

Submission Date: March 2026

Acknowledgment

I would like to express my sincere gratitude to my project guide Dr. Renuka Mane for the invaluable guidance, constant encouragement, and constructive feedback provided throughout the development of this mini project. Their expertise and mentorship significantly shaped the direction and quality of my work.

I am also grateful to the Department of Computer Science and Engineering, MIT World Peace University, Pune, for providing me with the resources, infrastructure, and academic environment necessary to undertake and complete this project successfully.

I extend my heartfelt thanks to my peers and classmates whose suggestions and discussions helped me refine my ideas and improve the overall quality of this project. Finally, I thank my family for their continuous support and encouragement throughout this journey.

Abstract

In this project, I designed and implemented a Smart Bus Finder and Booking System with safety-based route recommendations, developed using the C programming language. I addressed the practical problem of helping passengers make informed decisions when choosing bus routes between cities, with a particular emphasis on traveler safety.

I built and maintained a structured in-memory database of ten buses operating across major Maharashtra cities including Pune, Mumbai, Nashik, and Kolhapur, storing information such as departure and arrival times, driver ratings, route safety scores, and seat availability.

The core functionality I implemented includes: searching for direct routes between two cities, displaying available seats, calculating an adjusted safety score that accounts for night travel risk, facilitating seat booking with confirmation simulation via SMS and email, cancellation management, and an emergency SOS feature.

Key programming concepts I applied: structures, arrays, string manipulation, modular functions, and user-defined data types. This project demonstrates how I applied foundational C programming skills to build a practical, safety-aware public transport management tool.

Introduction

6.1 Problem Statement

Public bus transportation is one of the primary modes of travel across India, especially between cities in Maharashtra. I observed that passengers frequently face challenges in identifying safe, available, and convenient bus routes. Information about driver reliability, road safety conditions, night travel risks, and seat availability is rarely consolidated into a single accessible platform. This created a need for a simple yet effective software solution — one that I set out to build — to aggregate this information and guide travelers toward the safest available route.

6.2 Background / Context

With increasing road accidents and varying levels of driver competency across bus routes in India, I recognized a growing demand for data-driven decision-support tools in the public transport domain. Maharashtra's inter-city bus network covers routes such as Pune–Mumbai, Pune–Nashik, Pune–Kolhapur, and Mumbai–Nashik, among others. These routes differ significantly in road conditions, traffic density, and overall safety ratings. I also identified that night-time travel introduces additional risk factors due to reduced visibility and driver fatigue, and I incorporated this directly into my system.

I chose to implement this project in C — a foundational systems programming language taught in the Foundations of Programming course (CSE10010) at MIT World Peace University. The use of C structures, arrays, and modular functions made this an ideal mini project to reinforce core programming concepts while solving a real-world problem.

6.3 Objectives

The primary objectives I set for this project are as follows:

- To design a structured database of buses with relevant safety and scheduling attributes.
- To implement a search mechanism that identifies buses between any two specified cities.
- To calculate an adjusted safety score that factors in driver rating, route safety, and night travel risk.
- To provide a seat booking and cancellation system with simulated confirmation messages.
- To implement an emergency SOS feature that alerts authorities in case of a roadside emergency.
- To demonstrate the practical application of C programming concepts such as structures, arrays, string functions, and modular design.

Literature Review

I conducted a review of existing literature to understand current approaches to bus route management, passenger safety systems, and transportation recommendation tools. The following table summarizes 15 relevant research papers along with their key methodologies and limitations that I identified.

Sr.No.	Paper Title	Journal / Source	Methodology Used	Research Gap / Limitation	Metric
1	Real-time Bus Tracking using GPS and GSM	IEEE Trans. on ITS	GPS tracking, GSM alerts	No safety score computation	Latency, accuracy
2	Passenger Safety in Public Transport: A Review	Elsevier Transport Research	Survey analysis	No software implementation	Safety index
3	Route Optimization for Urban Bus Networks	J. of Transport Geography	Dijkstra's algorithm	Ignores driver behavior	Route efficiency
4	Data-Driven Safety Assessment for Road Transport	Accident Analysis & Prevention	Machine learning, regression	Requires large datasets	RMSE, accuracy
5	Bus Booking Systems: A Comparative Study	IJCST	System comparison	No safety integration	Usability score
6	Night Travel Risk Analysis in India	Indian J. of Transport Mgmt.	Statistical analysis	Region-specific, not scalable	Risk index
7	Driver Behavior Monitoring using IoT	IEEE IoT Journal	Sensor data, ML	High cost of hardware	Detection rate
8	Smart Transportation using C Embedded Systems	IJERA	C programming, sensors	Limited to embedded systems	Response time
9	Seat Reservation Systems in Railways	IJAER	Database modeling	Not applied to buses	Booking speed
10	Safety Alert Systems for Public Transport	IJCSE	Threshold-based alerts	No route recommendation	Alert accuracy
11	Multi-hop Route Planning	Transportation Science	Graph search	Does not consider safety	Path optimality

	for Intercity Travel				
12	User Preference in Bus Route Selection	J. of Advanced Transport	Surveys, AHP	Subjective, not automated	User satisfaction
13	Emergency SOS Features in Transport Apps	ACM MobiSys	App integration, GPS	Smartphone dependency	Response time
14	Simulation of Bus Fleet Management in C	IJCSI	Simulation, structures	No booking module	Simulation accuracy
15	Passenger Information Systems: A Global Review	Transport Reviews	Literature meta-analysis	No implementation provided	Coverage index

Key finding from my literature review: While significant work exists in GPS tracking, machine learning-based safety assessment, and route optimization, I identified a clear gap — no existing tool combined driver ratings, route safety, night travel penalties, seat booking, and emergency features in a single, lightweight C-language application. My project directly addresses this gap.

System Design / Methodology

8.1 Overview of the Approach

I designed the system as a menu-driven console application in C. I employed a flat-file, in-memory database of bus records initialized at program startup. The user interacts with the system through a numbered menu, and the program responds by performing the corresponding operation on the data structures. I ensured the design is fully modular, with each major functionality (search, book, cancel, SOS) encapsulated in dedicated functions.

8.2 Block Diagram

The system architecture I designed can be described as follows:

```
[ User Input ] → [ Main Menu Controller ]

                        ↓

[ Bus Search Module ] | [ Booking Module ] | [ SOS Module ] | [
Cancel Module ]

                        ↓

[ In-Memory Bus Database (struct Bus[10]) ]

                        ↓

[ Output: Console Display / Simulated SMS / Email ]
```

8.3 Components / Modules I Built

Data Structures I Defined

- struct Bus: Stores bus_id, from_city, to_city, dep_time, arr_time, driver, driver_rating, route_safety, current_route, total_seats, available_seats.
- struct Booking: Stores booking_id, bus_id, phone, email, passenger_name, seat_number, booking_time, status.
- struct User: Stores phone, email, and name of registered users.

Functional Modules I Implemented

- **`initBuses()`:** Initializes the bus database with 10 predefined routes.
- **`calculateAdjustedSafety()`:** Computes safety score incorporating night travel penalty.
- **`bookBus()`:** Handles the complete booking workflow including seat allocation and confirmation.
- **`cancelBooking()`:** Cancels a booking by booking ID and restores the seat count.
- **`emergencySOS()`:** Simulates sending SOS alerts with bus ID and location.
- **`registerUser()`:** Registers new users or retrieves existing ones.
- **`sendTicketConfirmation()`:** Simulates SMS and email ticket delivery.

- `cityExists()`: Validates user-entered city names against the database.

8.4 Algorithms / Techniques I Designed

Safety Score Calculation

I devised the following formula for the adjusted safety score:

$$\text{Adjusted Safety} = \text{driver_rating} + \text{route_safety} - (2 \text{ if night travel, else } 0)$$

I defined night travel as any trip where the departure hour is ≥ 20 (8 PM) or the arrival hour is ≥ 20. This penalizes late-night routes with a deduction of 2 points from the total safety score.

City Validation

Before any search or booking operation, I validate the user-entered city name using a case-insensitive string comparison (strcasecmp_custom) against all from_city and to_city fields in the bus database. Invalid city names are rejected with an appropriate error message.

Booking Algorithm

1. I prompt the user to enter source, destination, and select a bus by index.
2. I validate seat availability (available_seats > 0).
3. I register the user (or identify them if already registered) via phone/email.
4. I create a Booking record with auto-incremented booking_id, seat number, and status = 1.
5. I decrement available_seats and simulate a confirmation message.

Implementation

9.1 Development Environment I Used

- Programming Language: C (C99 standard)
- Compiler: GCC (GNU Compiler Collection)
- IDE / Editor: Visual Studio Code / Code::Blocks / Turbo C++
- Operating System: Windows 10 / Ubuntu 20.04
- Libraries Used: stdio.h, string.h, stdlib.h, time.h, ctype.h

9.2 Key Code Snippets I Wrote

Data Structure Definitions

```
struct Bus {

    int  bus_id;

    char from_city[30];

    char to_city[30];

    char dep_time[10];

    char arr_time[10];

    char driver[30];

    int  driver_rating;

    int  route_safety;

    char current_route[50];

    int  total_seats;

    int  available_seats;

};
```

Safety Score Calculation

```
int isNightTravel(char* dep_time, char* arr_time) {

    int dep_hour = getHourFromTime(dep_time);

    int arr_hour = getHourFromTime(arr_time);

    return (dep_hour >= 20 || arr_hour >= 20);

}

int calculateAdjustedSafety(struct Bus b) {

    int base_safety = b.driver_rating + b.route_safety;
```

```
    if (isNightTravel(b.dep_time, b.arr_time)) {
        return base_safety - 2;
    }
    return base_safety;
}
```

Booking Function

```
void bookBus(int bus_index, char* phone,
             char* email, char* passenger_name) {
    if (buses[bus_index].available_seats <= 0) {
        printf("No seats available!\n");
        return;
    }
    int user_index = registerUser(phone, email, passenger_name);
    struct Booking new_booking;
    new_booking.booking_id  = 1000 + booking_count;
    new_booking.bus_id      = buses[bus_index].bus_id;
    strcpy(new_booking.phone,          phone);
    strcpy(new_booking.email,          email);
    strcpy(new_booking.passenger_name, passenger_name);
    new_booking.seat_number = buses[bus_index].total_seats
                            - buses[bus_index].available_seats + 1;
    new_booking.status = 1;
    bookings[booking_count] = new_booking;
    buses[bus_index].available_seats--;
    sendTicketConfirmation(&new_booking, &buses[bus_index]);
    booking_count++;
}
```

Emergency SOS

```
void emergencySOS(int bus_id, char* current_location) {
    printf("\n EMERGENCY SOS ACTIVATED!\n");
```

```
    printf("Bus ID:   %d\n",  bus_id);

    printf("Location: %s\n",  current_location);

    printf("Time:     %s IST\n", __TIME__);

    printf("SOS Message Sent Successfully!\n");

}
```

9.3 Testing

I designed and executed the following test cases to verify system correctness:

Test Case	Input	Expected Output	Actual Output	Pass/Fail
TC01	Source: Pune, Dest: Mumbai	List buses 101, 102, 107 with safety scores	Buses displayed correctly	Pass ✓
TC02	Source: XYZ (invalid city)	Error: No such city in dataset	Error message displayed	Pass ✓
TC03	Book Bus 0, phone/email/name provided	Booking confirmed, seat decremented	Confirmation printed	Pass ✓
TC04	Cancel Booking ID 1000	Booking cancelled, seat restored	Cancellation confirmed	Pass ✓
TC05	Night bus Mumbai→Pune (Bus 104)	Safety score = 4+4-2 = 6	Score 6 displayed correctly	Pass ✓
TC06	SOS for Bus ID 104	SOS alert with location printed	Alert displayed correctly	Pass ✓
TC07	Book all seats then book again	No seats available message	Error displayed correctly	Pass ✓
TC08	Cancel already-cancelled booking	Booking not found error	Error message displayed	Pass ✓

Results and Discussion

10.1 Output

I successfully compiled and executed the program on GCC. The system correctly handles all five menu options: finding buses between cities, listing all routes from a city, booking a ticket, cancelling a booking, and sending an SOS alert.

Sample Output 1 – Bus Search (Pune to Mumbai)

```
Pune → Mumbai:

ID    Seats   Driver   Time    Safety

-----------------------------------------

101   5/40    Raj      06:30   8/10

102   2/40    Anil     09:00   5/10

107   4/40    Mahesh   14:00   8/10
```

Sample Output 2 – Ticket Confirmation

```
SMS SENT TO:   9876543210

EMAIL SENT TO: passenger@email.com

========================================

TICKET CONFIRMED!

Booking ID : 1000

Bus ID     : 101 (Pune -> Mumbai)

Passenger  : Ravi Kumar

Seat       : 6

Departure  : 06:30

Status     : CONFIRMED

========================================
```

Sample Output 3 – Emergency SOS

```
EMERGENCY SOS ACTIVATED!

========================================

ALERT SENT TO EMERGENCY CONTACTS

Bus ID          : 104

Current Location: Mumbai-NH48-Panvel
```

```
Time            : 21:30 IST

SOS Message Sent Successfully!

Help is on the way! Stay safe.
```

10.2 Analysis

The results demonstrate that my system meets all stated objectives. The safety score calculation I designed correctly penalizes night routes — for instance, Bus 104 (Mumbai to Pune, 21:00 departure) receives a safety score of 6 out of 10 (driver_rating 4 + route_safety 4 – 2 penalty), compared to Bus 101 (Pune to Mumbai, 06:30 departure) which receives 8 out of 10. This distinction helps passengers make informed decisions.

The booking system I built correctly manages seat allocation and restores availability upon cancellation. The modular design I chose ensured that each function could be tested independently, reducing debugging time and improving code maintainability. The case-insensitive city search I implemented prevents user errors from causing unnecessary failures.

Conclusion

This mini project successfully demonstrates the design and implementation of a Smart Bus Finder and Booking System using the C programming language. I integrated multiple functionalities including safety-aware route search, seat booking with simulated notifications, booking cancellation, and an emergency SOS feature into a cohesive, menu-driven application.

All objectives I set at the start have been fully achieved. The safety score algorithm I devised effectively incorporates driver quality, route conditions, and night travel risk into a single metric that guides passenger decisions. The modular code structure I followed ensures maintainability and readability, while my use of C structures, arrays, and string functions reinforces foundational programming concepts covered in CSE10010.

This project validates that I can apply fundamental C programming skills to build practical, impactful software tools. The system is functional, logically sound, and aligns well with real-world requirements for public transport management.

Future Scope

The implementation I completed provides a solid foundation that can be extended significantly. The following improvements I propose for future development:

- **Database Integration:** Replace the in-memory array with a persistent file-based or relational database (e.g., SQLite) to retain booking data across program sessions.
- **Graphical User Interface:** Develop a GUI using frameworks such as GTK or Qt to improve user experience beyond the console interface.
- **Real-Time GPS Integration:** Incorporate GPS modules to track bus locations in real time and provide dynamic safety alerts based on live traffic and road condition data.
- **Mobile Application:** Port the logic to a mobile application (Android/iOS) to make the system accessible to a wider user base.
- **Payment Gateway:** Integrate a payment processing module to enable actual ticket purchases rather than simulated confirmations.
- **Machine Learning Safety Scores:** Use historical accident data and driver performance records to dynamically compute safety scores using machine learning models.
- **Multi-City Route Planning:** Implement Dijkstra's or A* algorithm to support multi-hop route planning across any combination of cities in the database.
- **Admin Panel:** Develop an administrative interface for bus operators to update schedules, seat counts, and driver information in real time.
